

Introduction:

Our advice and information material is based on many years of experience in our hatchery business, our own personal aquarium-keeping experience, as well as on conversations and new information we have gathered at the many fairs and exhibitions we have taken part in, over recent years.

Naturally, we don't want to interfere with your own approach to aquarium-keeping; rather we would like to provide you with information on how you can easily and successfully keep our STENDKER Discus Fish, even as a first-time aquarium owner.

We aim to help prevent aquarium owners making the same, typical basic mistakes, so that you will have maximum enjoyment from our discus fish and so that our fish can thrive in excellent conditions in your aquarium.

Please take a little time in advance to read our tips and recommendations and make sure to set up your aquarium thoroughly and without rushing. Thorough preparation is the key for a good start for your aquarium.

Ideally, you should continue to feed our discus fish with our STENDKER Discus Feed, which they are accustomed to and enjoy eating. Our feed contains all nutrients that discus fish require for healthy growth and a balanced, healthy diet.

The weekly work involved in keeping a 450 litre / 120 US gallons aquarium with 12 discus fish, companion fish and plants takes approx. 1 hour per week (which includes a water change and daily feeding). The less you "tamper" with your aquarium, the better it is for your fish – because any changes you make could disrupt the biological equilibrium in your underwater world. Our STENDKER Discus Fish are ideal pets – even for busy people, who love nature and want to relax.

We wish you a good start and lots of success and enjoyment with our STENDKER Discus Fish.
